

VolkerWessels Telecom & Speer IT: working together in connectivity

Fiber optic networks meet the growing demand for more speed and more data. These networks deliver higher bandwidths at lower costs than the traditional telecom networks. Specialists at VolkerWessels Telecom are working on the design, build, management and maintenance of fiber optic networks. Speer IT is the software partner of VolkerWessels Telecom.

A stable, reliable and safe fiber-optic infrastructure

The fiber optic network is growing on a daily basis and becomes increasingly more complicated. An organised fiber optic infrastructure is essential for the network administrator. It is the only way to maximise the use of the network and to map all potential bottlenecks. Fiber optic registration - physical mapping and monitoring of fiber-optic networks - enables the organisation of physical fiber optic infrastructures. VolkerWessels Telecom uses Cocon software for its fiber optic registration.

Cocon

Cocon is the smart, fast and user-friendly fiber optic registration system of Speer IT. Using Cocon, VolkerWessels Telecom maintains an overview of the most complicated fiber optic network structures it installs and manages. Cocon has meanwhile become the standard in the Netherlands. Large international telecom organisations use Cocon too.

Why Cocon?

- User-friendly and fast management of any type of fiber optic network (FTTH, FTTO, FTTB, Smart City)
- Current and future network management in the same environment
- Simple routing of tracks and calculation of new connections
- Automatic handling of excavation notifications and making these geographically visible
- Managing planned interruptions and making failures visible

'Ever since we use the Cocon application, we are able to manage our fiber optic networks in a much easier and more efficient way. We make far better use of the capacity of our clients' existing networks.'

Leroy Bontrop

Projectleader of VolkerWessels Telecom
